An AI-Powered App that will help the user deduct their taxes. How it works is that it will scan a receipt and take the data from that receipt to automate the bookkeeping, and when tax day comes, a consumer can claim their receipt as tax-deductible.

Milestone 1: Ensure that Stylesheet is integrated into the main app
Milestone 2: Improve the GUI and overall looks of the app
Milestone 3: Core React Navigation is complete
Milestone 4: Fix the Supabase connection to individual users are working
Milestone 5: Create the receipt database for each individual user with Supabase
Milestone 6: Finalize all supabase connections
Milestone 7: Ensure that all core functionality is working(Navigation, Adding Receipts into the database, Log-ins, & Optimization for the code)
Milestone 8: Integration of AI in the camera system
Milestone 9: Train AI for all receipts
Milestone 10: Finalize the full AI and

Tech Stack:
1. Typescript(Full-Stack)
2. Supabase(SQL)
3. Google AI Studio(AI-Integration)

Eisenhower Matrix: TaxMuncher Project

Urgent & Important (Do First)	**Important & Not Urgent (Schedule)**
● **Milestone 4:** Fix the Supabase connection so individual users are working ● **Milestone 5:** Create the receipt database for each individual user with Supabase ● **Milestone 6:** Finalize all Supabase connections ● **Milestone 8:** Integration of AI in the camera system (Google AI Studio)	● **Milestone 3:** Core React Navigation is complete ● **Milestone 7:** Ensure all core functionality is working & optimize code ● **Milestone 9:** Train AI for all receipts ● **Milestone 10:** Finalize full AI integration
Urgent & Not Important (Delegate)	**Neither Urgent nor Important (Don't Do)**
● **Milestone 1:** Ensure Stylesheet is integrated into the main app	● **Milestone 2:** Improve GUI and overall looks of the app (Defer until core features are finalized)
